

## **VARIABLE AND DATA TYPES**

Card 4 of 10 I'm Learning: Javascript

Just like the common data types, you can also **store** jQuery objects in a variable and the process is the same.
Add the code below the "numClicks" variable you created.

```
var ball = $("#magic8ball");
var ballText = $("#magic8balltext");
```

Create a new variable named "input" inside the click function that will store the questions written inside the input box.

```
var input = $.trim($("#input_box").val());
```

**Tip: trim()** function can be used to remove (white) spaces from both sides of a string.

4 **Below** the "input" variable, **use** console.log() to show the default value that is inside the input box in the console of the debugger tool.

```
console.log(input);
```

## **Fun fact:**

Unlike Java, **JavaScript** is a loosely typed language. It means that variables used in the program do not have a definite type. A variable can be of **any** type and they are all created with the keyword "var".
